© by VARTA Microbattery GmbH, February 2008
VARTA Microbattery is a leading company in the field of batteries and provides professional support for customers with engineered design-in applications worldwide. Quality, reliability, high performance and customer satisfaction are the main reasons for our leading position in the market. VARTA Microbattery provides solutions to major OEM companies for high-tech applications such as notebook/PDA- bridging function, memory backup and real-time clock support in PCs/notebooks as well as main Power source for telecom devices, remote control devices, torches, domestic alarms, car alarms, medical equipment, consumer electronics and many more. VARTA Microbattery produces all major chemistries in various form factors. We are well equipped with facilities for customized battery products. We trust we will have an optimized battery solution for most application requirements. VARTA Microbattery provides rechargeable batteries in these electro-chemical systems: Ni-MH, Li-Ion and Li-Polymer “VARTA PoLiFlex®”. For primary systems please see rear side.

SYSTEM HIGHLIGHTS OF VARTA PoLiFlex® BATTERIES:

- Very slim – down to 2.2 mm (0.8 mm*) mm
- Excellent energy density
  - up to 450 (incl. PCM) / 500 (pouch) mWh/l
  - up to 195 mWh/g
- Flexible formfactor
- High cell voltage (3.7 V nom.)
- Low self-discharge
  - <5% fully charged, 2% SOD (state of delivery) in the first month, less thereafter
- Charging technique compatible with Li-Ion (const. I / const. V)
- Good high-rate discharge capability
  - up to 5 CA pulse loads (see specifications)
- Wide temperature range:
  - Storage: -20...+60°C
  - Discharge: -20...+60°C
  - Charge: 0...+45°C

- Good cycle-life
  (>500 full cycles typically)
- Good recovery of capacity after storage, even at elevated temperature
- UL listed/recognized
- Environmentally friendly
  - 0% lead, cadmium, mercury (ISO 14001 certified)
- ISO 9001 certified for design and manufacture
- VARTA Microbattery is a leader in the field of Polymer Batteries, received several awards for innovation and environment protection.

ENERGY DENSITY FOR RECHARGEABLE BATTERY SYSTEMS:

FIG. 1
Comparison of different rechargeable battery systems regarding their energy densities

A = Lithium Polymer
B = Lithium-Ion
C = Ni-MH
D = Ni-Cd
E = Lead
1.1 DEFINITIONS

BASICALLY

Unless otherwise stated the technical values and definitions are based on room temperature conditions (RT = 20°C ± 2°C).

SYSTEM – SPECIFIC DATA

The gravimetric energy density of the Li-Polymer system depends on battery size and ranges from approx. 170-200 Wh/kg and the volumetric energy density ranges from approx. 350-450 Wh/l incl. PCM.

VOLTAGE DEFINITIONS

Open Circuit Voltage (OCV):
Equilibrium potential 3.0 V to 4.2 V on average, dependent on temperature, storage duration and state of charge.

Nominal Voltage of Li-Polymer cells is 3.7 V.

End of Discharge Voltage (Ve):
The voltage at the end of discharging is 2.75 V to 3.2 V per cell, depending on discharge rate and temperature.

End of Charge Voltage:
Terminal voltage after charge is 4.2 V.

CAPACITY DEFINITIONS

The capacity C of a cell is defined by the discharge current I and the discharge time t: \( C = I \cdot t \)
I = constant discharge current
t = duration from the beginning of discharge until the end of discharge voltage is reached

Nominal Capacity:
The nominal capacity C denotes the energy amount in mAh (milli-Ampère hours) that the cell can deliver at the 5h discharge rate (0.2 CA). The reference temperature is +20°C ± 2°C, and the final discharge voltage 3.0 V.

Typical Capacity:
The typical capacity is the average capacity at a discharge rate of 0.2 CA to a final discharge voltage of 3.0 V.

Available Capacity:
Li-Polymer cells deliver their nominal capacity at 0.2 CA. This assumes that charging and discharging is carried out as recommended. Factors which affect the available capacity are:
- Rate of discharge
- End of discharge voltage
- Ambient temperature
- State of charge
- Age
- Cycle history

At higher than nominal discharge rates the available capacity is accordingly reduced.

CURRENT DEFINITIONS

Charge and discharge rates are given as multiples of the nominal capacity (C) in amperes (A) with the term CA. Example:
Nominal capacity \( C = 1000 \text{ mAh} \)
0.1 CA = 100 mA, 1 CA = 1000 mA

Nominal Discharge Current:
The nominal discharge current of a Li-Polymer cell is the 5 hour discharge current (0.2 CA). It is the current at which the nominal capacity of a cell is discharged in 5 hours.
\( I = \frac{C}{0.2} = \frac{1000}{0.2} = 0.2 \text{ CA when } t = 5 \text{ h} \)
VARTA PoLiFlex® batteries are first choice for a number of modern high-tech products in the portable electronics field. They provide long lasting, reliable main power, occupying a minimum of space and weight in the corresponding devices.

VARTA PoLiFlex® batteries fulfill the most important design-in requirements: Reliable high-power output, design flexibility with a minimum of space requirement and a slim form-factor.

**TAB. 1**  
Features VARTA PoLiFlex® batteries
VARTA PoLiFlex® batteries are especially suitable for modern electronic applications like mobile phones, PDAs, notebooks, MP3 players, security and telematic devices and many more.

These super-slim batteries are the ultimate power source for your electronic devices and make your products smaller, lighter and more attractive.

VARTA PoLiFlex® – outstanding performance and reliability, excellent quality along with great form flexibility.

VARTA PoLiFlex® – go for the new generation.

MP3 players / Consumer electronics

Notebooks / Tablet PCs

Mobile / Smart phones

PDAs / Navigation devices

FIG. 2 – 5: Application examples
Choose the best suitable battery from our wide range of VARTA PoLiFlex® according to your needs relating to the specific application and its corresponding planned operation conditions:

The most important criteria for the type-selection are these:

- Required minimum operating time
- Max. and average current drain
- Min. and max. voltage of operation
- Operating temperature range
- Mechanical properties
- Available space
- Environmental conditions

All batteries VARTA PoLiFlex® are equipped with our specially selected and carefully designed safety electronic modules which prevent the risks of hazards due to any foreseeable abuse / misuse.

You can choose a cell of the VARTA PoLiFlex® range for professional design-in between these boundaries:

- Op. voltage: 2.75 … 4.2 V
- Capacity: 360 … 1320 mAh
- Height: 2.2 (0.8*) … 6.2 mm
- Area (surface): 34 x 41 … 35 x 66 mm

* please contact our sales staff

The worldwide present VARTA Microbattery professional design-in team will be happy to assist you with further recommendations and will guide you through the whole cycle of your product life.

**TAB. 3**

Technical Data VARTA EasyPack battery portfolio
3. CHARGING / DISCHARGING
3.1 CHARGING

Fast charging can be achieved in a temperature range of 0 … +45°C.

The current of charging needs to be limited to the 1 C rate max. (e.g. a 1Ah battery can be charged with 1 A max.)

In order to avoid overcharging along with damaging the battery or even hazardous situations, the charging voltage has to be limited strictly with 4.2 V per cell in a narrow tolerance of ± 50 mV.

It is recommended to terminate the charging either after 3hrs and/or after the charging current falls below 0.02 C.

The charging process is illustrated below showing current and voltage of a VARTA PoLiFlex® cell using the 1 C I/V – charging.
Due to their low impedance VARTA PoLiFlex® batteries are capable of providing very high levels of current. In order to obtain still a sufficiently high capacity efficiency a continuous discharge current of 2C should not be exceeded. However short current impulses of substantially higher levels are obtainable. Since all VARTA PoLiFlex® batteries are delivered with a safety-circuit the max. current rating established in the electronic module must be observed. There are two levels of overcurrent protection of which the first one will lead to a reversible interruption of current supply, while exceeding the second level will make the battery unuseable permanently.

Please ask our experts for details of the safety-parameters built into our modules which are set differently depending on the type designation.

4. INDIVIDUAL SPECIFICATIONS
4.1 VARTA PoLiFlex® PLF 223452 D

Mechanical:
- Height: 2.3 mm (max. at delivery)
- Width: 34.0 mm
- Length: 52.2 mm

Temperature:
- Charging: 0 to +45°C
- Discharging: -20 to +60°C
- Storage: 1 year at -20 to +20°C >80%

Life expectancy: >500 cycles (>70% of Cmin)

Impedance: <80 mΩ @ 1kHz (cell)
4.2 VARTA PoLiFlex® PLF 263441 D

Mechanical:
- Height: 2.8 mm
- Width: 34.0 mm
- Length: 41.2 mm

Temperature Charging: 0 to +45°C
Temperature Discharging: -20 to +60°C
Temperature Storage: 1 year at -20 to +20°C >80%
Life expectancy: >500 cycles (>70% of Cmin)

Temperature Profile @ 1C

**FIG. 70**
Temperature Profile @ 0.2C

**FIG. 71**
Cycle life @ 20°C
Cycle life is expected to be 500 cycles with a remaining capacity of >70%. Even at elevated temperature the VARTA PoLiFlex® cells show excellent performance and very little swelling.

VARTA PoLiFlex® batteries together with the VARTA EasyPack range represent the state of the art technology in Polymer batteries. They combine maximum safety with top-performance and reliability.
6. STORAGE

VARTA PoLiFlex® batteries are delivered in a state of charge which gives the best of long-term storage performance being approx. 60% of their full capacity. This enables the best conditions for long term storage.

Most serious storage condition for all rechargeable Li-Ion/Polymer/VARTA PoLiFlex® cells and batteries is the fully charged state (CC/CV 4.2 V, 3h). This state leads to a self-discharge (retention capacity) and to a certain irreversible capacity loss depending on the temperature during storage (recovering capacity).

Trickle charge, like in aqueous battery systems (Ni-Cd, Ni-MH), is not necessary due to the very low self discharge. Continuous charging will cause to performance loss.

![Graph of retention and recovery capacity after various storage conditions](image)

**FIG. 74**
Retention and recovery capacity after various – even abusive – storage conditions

![Graph of cell height after various storage conditions](image)

**FIG. 75**
Cell height after various – even abusive – storage conditions
7. SAFETY

All VARTA PoLiFlex® batteries as well as VARTA EasyPacks are equipped with an electronic module for protection against malfunction of charging and discharging, misuse and abuse.

Moreover, VARTA PoLiFlex® electrochemistry is designed by selecting ingredients and components which provide the best of performance data combined with excellent inherent safety features for usage within reasonable boundaries of specifications.

To cope with any foreseeable abuse of our batteries, we have implemented a number of safety criteria which are usually multi-redundant with a carefully designed application device, a charging circuitry in particular.

It is VARTA Microbattery’s policy to have all new cells tested and listed/recognized by UL (a worldwide acting, non-profit organisation in the field of consumer safety protection), according to the standard UL 1642. Relevant testing requirements, which represent to us the minimum level of safety testing, are given in the table below:

<table>
<thead>

TAB. 4
Required safety tests for VARTA PoLiFlex® cells
In general, lithium batteries are subjected to transport regulations depending on the means of transportation. But all batteries sold by VARTA Microbattery which are listed in this handbook are not subjected to the transport regulations of dangerous goods, because they fulfill the following requirements (Special provisions ADR 188, IATA A45, IMDG 188):

- The batteries contain not more than 1.5 g lithium equivalent per cell respectively 8 g lithium equivalent per battery.
- The batteries passed the safety tests according to clause 38.3 of the UN Manual of Test and Criteria.
- The batteries are isolated in the packaging to avoid short circuits.
- The packs are marked with a warning notice that clearly states that the pack contains rechargeable lithium batteries and must be quarantined, inspected and repacked if damaged.
- The total mass does not exceed 30 kg per pack.

Used lithium batteries have to be handled like fresh ones.

We do not recommend to weld terminals to the batteries; this should only be done by qualified personnel with the proper equipment.
9. PROPER USE AND HANDLING

Preface

Lithium batteries provide a high energy density which is often combined with a high rate capability to the benefit of the customer. Due to this excellent performance properties, Lithium batteries contain a certain safety risk. If short-circuited, heat and sometimes sparks may be generated. Mistreatment outside of the recommended limits can cause gas generation, leakage and fire. This guideline “Handling Precautions and Prohibitions for VARTA PoLiFlex® batteries and general supply notices” shall be applied to all VARTA PoLiFlex® batteries and their component cells, which are manufactured by VARTA Microbattery GmbH. It shall be brought to the attention of all persons who handle the batteries.

Note: The customer is requested to contact VARTA Microbattery GmbH in advance, if and when the customer needs other applications or operating conditions than those described in this document, because additional tests and experiments may be necessary to verify performance and safety under such conditions. VARTA Microbattery GmbH shall not be responsible for safety, performance, functionality, compatibility or fitness for a particular purpose unless such features have been expressly communicated and described in the specification.

Note: VARTA Microbattery GmbH will take no responsibility for any accident when the cell is used under other conditions than those described in this guideline.

Note: VARTA Microbattery GmbH will inform, in a written form, the customer of improvement(s) regarding proper use and handling of the cell, if it is deemed necessary.

Note: Do not modify cells or batteries without prior written approval by VARTA.

1. Charging

1.1 CHARGING CURRENT
Charging current should not exceed maximum charge current specified in the Data Sheet. Charging with higher current than recommended may cause damage to cell performance and safety features, and can lead to heat generation or leakage.

1.2 CHARGING VOLTAGE
Charging at above 4,250 V, which is the absolute maximum voltage, is strictly prohibited. The charging has to be done according to the data sheet. The charger shall be designed to conform with this condition. Use specified charger only. Charging with higher voltage than specified may cause damage to cell performance and safety features, and can lead to fire, heat generation or cell leakage.

1.3 CHARGING TEMPERATURE
The cell shall be charged within the range of specified temperatures in the Data Sheet. If the cell is charged at a temperature out of the specified range, leakage, heat generation, or other damages may occur. Repeated charging and discharging at high and low temperature may cause degradation of cell performance even within the specified temperature range.

1.4 PROHIBITION OF REVERSE CHARGING
Reverse charging is prohibited. The cell shall be connected correctly. The polarity has to be confirmed before connecting any wires. If the cell is connected improperly, it can not be charged. Reverse charging may cause damage to the cell(s) and may lead to a loss of cell performance and cell safety, which can lead to heat generation or leakage.

2. Discharging

2.1 DISCHARGE CURRENT
The cell shall be discharged at less than the maximum discharge current specified in the Data Sheet. High discharge current may reduce the discharging capacity significantly, or cause overheating.

2.2 DISCHARGE TEMPERATURE
The cell shall be discharged within the temperature range that is specified in the Data Sheet.

2.3 OVERDISCHARGING
It should be noted that the cell(s) will be overdischarged if the cell(s) is/are not used for a long time. In order to prevent overdischarging, the cell(s) shall be charged periodically to maintain about 3 V to 3.8 V. Overdischarging may cause loss of cell performance, or damage battery function. The application device shall be
9. PROPER USE AND HANDLING

equipped with a device to prevent further discharging exceeding a **cutoff voltage** specified in the data sheet. Also the charger shall be equipped with a device to control the recharging procedures as follows: In case of overdischarging, the cell(s)/battery pack shall start with a low current (0.01 - 0.07 CmA) for 15-30 minutes, i.e. precharging, before rapid charging starts. The charging according to the Data Sheet shall be started after the individual cell voltage has risen above about 3 V within 15-30 minutes, which can be determined and controlled by the use of an appropriate timer for precharging. In case the individual cell voltage does not rise to about 3 V within the pre-charging time, the charger shall have functions to stop the further continuous charging and display that the cell(s)/pack is in an abnormal state.

3. Protection Circuit Module (PCM)

3.1 The cell(s)/battery pack shall be provided with a **PCM** which can protect cell(s)/battery pack properly, e.g. in case of failing Charge Control Circuit.

3.2 PCM shall have functions of (i) overcharging prevention, (ii) overdischarging prevention, and (iii) over current prevention, to maintain safety and prevent significant deterioration of cell performance. The overcurrent can occur by external short circuit.

3.3 OVERDISCHARGE PROHIBITION

Overdischarge prevention function shall work to minimize a dissipation current to avoid further drop in cell voltage below 2,5 V or less per cell in either cell of the battery pack. It is recommended that the dissipation current of PCM shall be designed to be minimized to 0,5 micro-amperes or less after the over-discharge prevention function activates. The protection function shall monitor each cell of the battery pack for controlling current at all times.

4. Application

For the batteries approved by UL (File MH13654) the intended use is at ordinary temperatures where anticipated high temperature excursions are not expected to exceed 70°C. Nevertheless under reasonably foreseeable misuse conditions at temperatures up to 85°C over 4 hours no safety risk occurs.

4.1 USER REPLACEABLE APPLIANCES

VARTA PoLiFlex® batteries can be used as user replaceable batteries if the following conditions are fulfilled:

- The end product must be designed to prevent reverse polarity installation of the battery, or if the battery is reversed, the short or open circuiting of any protective component, one component at a time, shall not result in forced discharge of the battery.
- The end product shall contain a permanent marking adjacent to the battery stating the following or equivalent:
  "Replace battery with (Battery Manufacturer’s name or endproduct manufacturer’s name), Part No. (...) only. Use of another battery may present a risk of fire or explosion. See owner’s manual for safety instructions” or “The battery used in the (End Product Name) must be replaced at (End product manufacturers’s) service center only.”

If it is not feasible to include the above marking on the device, the marking may be included in the operating (or safety) instructions providing the battery compartment is marked with the following: “See operating (or safety) instructions for type of battery to be used.”

- The instruction manual supplied with the end product shall also contain the above warning notice along with instructions to the user as to where replacement batteries can be obtained. The instruction manual shall also contain the following additional warning notice and information:
  - **Caution:** The battery used in this device may present a fire or chemical burn hazard if mistreated. Do not disassemble, heat above 100°C (212°F) or incinerate.
  - Complete instructions as to how to replace the battery ending with the statement: “Dispose of used battery promptly. Keep away from children.”

4.2 TECHNICIAN REPLACEABLE APPLIANCES

If the conditions 4.1 a) - c) are not fulfilled VARTA PoLiFlex® batteries can be used only in devices where servicing of the battery circuit and replacement of the lithium battery will be done by a trained technician.
9. PROPER USE AND HANDLING

5. Storage

The cells shall be stored within a **proper temperature range** as specified in the Data Sheet. The state of charge shall be 50% of the nominal capacity; open circuit voltage OCV about 3.8 V. When stored for a long time, care has to taken that the battery voltage does not drop below the cut-off voltage due to self discharge (see 2.2).

6. Others

6.1 CELL CONNECTION

Soldering of wires **directly to the cell** is strictly prohibited. Tabs with presoldered wiring shall be welded to the cells. Direct soldering may cause damage of components, such as separator and insulator, by heat.

6.2 ULTRASONIC WELDING OF BATTERY PACK CASING

Ultrasonic welding of plastic lid to the plastic casing can be applied. However, the welding shall be done **avoiding the application of ultrasonic wave power directly to the cells and the PCM electronic**. Otherwise it may cause serious damage to the cells and/or PCM electronics.

6.3 PREVENTION OF SHORT CIRCUIT WITHIN A BATTERY PACK

Enough **insulation layer(s)** between wiring and the cells shall be used to maintain multiple safety protection. The battery pack shall be designed to prevent short circuits within the battery pack. This is because that short circuits within the pack may cause **generation of smoke or fire**.

6.4 ASSEMBLY

- **Important!!** Always avoid any possible contact of softpack/safety module with sharp objects, corners, or points which could puncture or damage it.
- Avoid applying mechanical stress (such as tension, pressure, or rubbing) to cell itself and softpack/safety module during assembly. Do not remove, disassemble any component from the original VARTA supply configuration.
- Assembly and finishing processes to be done only with ESD protection conditions.
- Do not subject softpack/safety module to higher temperatures than specified in datasheet provided.
- Do not subject softpack/safety module to ultrasonic weld process vibration or energy.
- Avoid accidental shortcircuit of softpack/safety module during assembly and finishing processes.
- Avoid accidental mechanical damage to softpack/safety module during assembly and finishing processes.
- Packaging for softpack/safety module assembly to be only with ESD-safe (anti-static) material

6.5 PROHIBITION OF DISASSEMBLY

- Never disassemble the cells.
- **Disassembling cells** may cause an internal short circuit in the cell, which could further **cause gassing, fire, or other problems**.
  
  **Harmful Electrolytes:**
  
  An electrolyte which leaks out from the cells is harmful to the human body. If the electrolyte comes into contact with the skin, eyes or others parts of body, the electrolyte shall be flushed immediately with fresh water. Seek medical advice from a physician.

6.6 PROHIBITION OF SHORT CIRCUIT

Never short circuit the cells. It causes generation of very high currents resulting in heating of the cells, which may cause electrolyte leakage, gassing or fire. An appropriate circuitry with PCM shall be employed to prevent accidental short circuit of the battery pack.

6.7 PROHIBITION OF DUMPING OF CELLS INTO FIRE

Never incinerate nor dispose of cells into fire.

6.8 PROHIBITION OF CELLS IMMERSION INTO LIQUID SUCH AS WATER

The cells shall never be soaked with liquids such as water, sea water, drinks such as soft drinks, juices, coffee or others.

6.9 BATTERY CELLS REPLACEMENT

The battery replacement shall be done only by either cell supplier or device supplier and never be done by the user.

6.10 PROHIBITION OF USE OF DAMAGED CELLS

Cells have a chance to be damaged during shipping by shocks, or other causes. If any abnormal features of the cells are found such as: damage to a plastic envelope of the cell, deformation of the cell container, smell of electrolyte, an electrolyte leakage, or other abnormalities, the cells shall not be used any more. Cells with a smell of electrolyte or leakage shall be kept away from fire to avoid ignition.
9. PROPER USE AND HANDLING

6.11 GENERAL SUPPLY NOTICES AND RESPONSIBILITIES
The customer agrees to manufacture, assemble, sell, transport and/or dispose of the Finished Products so that the health and safety of people, including workers and general public, and environmental protection can always be cared by applying the standard to be determined in compliance with the requirements therefore of the laws and regulations in the countries where the Finished Products are sold. The customer shall be solely responsible for health, safety and environmental matters arising from its manufacture, assembly, sales, use, transportation and/or disposal of the Finished Products, and shall defend, indemnify, and hold VARTA Microbattery GmbH, its subsidiaries, and customers, and its and their respective representatives and employees harmless from and against all costs, liabilities, claims, lawsuit, including but not limited to attorney’s fees, with respect to any pollution, threat to the environment, or death, disease or injury to any person or damage to any property resulting, directly or indirectly, from the manufacture, assembly, purchase, sales, use, operation, transportation or disposal of the Finished Products; except to the extent that the customer shall be exempted from such obligation if and so long as the cause of such damage is attributable directly and solely to VARTA Microbattery GmbH.

6.12 BATTERY PACK STRUCTURE
- Protection circuit shall be isolated from the cell to diminish damage from any electrolyte leakage which may occur by mishap. The battery pack shall as much as possible be designed to not allow leaked electrolyte access to protection circuit.
- Battery case material tolerance for electrolyte shall be considered when battery case material is selected.

6.13. PROTECTION CIRCUIT MODULE DESIGN
- Electrolyte has corrosive characteristics. Protection circuit module may not work correctly if exposed to electrolyte.
- These points should be considered in protection circuit module design. Main wiring patterns shall be separated from each other as much as possible. Conductive patterns and connection terminals that are possible to be short-circuited by electrolyte leakage should be separated from each other as much as possible.

Another method is coating the whole surface of the module by conformal coating material.
- PCM contains CMOS devices! Make sure ESD protected work-space is used when handling PCMs.

7. Marking
The customer shall prepare comprehensive instructions and appropriate markings for end users. The battery packs shall be provided with packing and handling, or safety instructions regarding cell usage, storage, and replacement, and shall be marked with information in accordance with applicable regulations. The prohibitions mentioned in this document, regulations in UL 1642 (and other specifications) shall be clearly explained to the users.

The markings shall also be done in accordance with requirements based on guidelines for rechargeable Lithium Ion batteries for maintaining safety of the cells. Example for marking according to the UL 1642 regulation:
- Mark the manufacturer's name, business name or trademark, and specified model name.
- Use the word “Warning” or “Caution” and indicate the statement “Potential for Fire or Burning. Do Not Disassemble, Crush, Heat, or Burn” or equivalent.
- Final product shall be marked with following statement or equivalent: “Replacement may only be made with Battery Pack specified by the final product manufacturer, with correct Part Number. Fire or burning may occur if the customer uses Battery Pack other than specified by the final product manufacturer. The customer shall refer to the handling instruction issued by the final product manufacturer.”

If it is not possible to mark the warnings mentioned above on the final products, the final product manufacturer shall mark and print the warnings in the handling or maintenance instructions or manuals of the products. Specially the marking shall contain the advices in 4.1 and 4.2 according to the type of usage.
10. BATTERY ASSEMBLY

10.1 DESIGN GUIDELINES FOR VARTA PoLiFlex® BATTERY PACKS

In general, we strongly recommend for any design-in to consult VARTA sales engineer. For applications in medical, military and intrinsic safe environment consult VARTA for approval.

VARTA PoLiFlex® batteries fulfill the most important design-in requirements: Reliable high-power output, design flexibility with a minimum of space and a slim form-factor.

For the battery design-in process VARTA Microbattery has specified the following Design Guidelines to guarantee high quality, best performance, safety and optimal design for battery packs created with VARTA PoLiFlex® cells, made for the new generation of modern electronic portable devices:

**PCM**

It is recommended to use VARTA PoLiFlex® soft packs with a suitable PCM (with which all cells are already equipped when leaving VARTA Microbattery) for further assembly. If another PCM needs to be used please contact our sales staff; we recommend to let review the suitability by our engineers.

**Passive Safety Elements**

As secondary protection a passive safety element like PTC, Thermofuse or Current Fuse should be used.

**Battery Design**

For plastic casing packs sealed by ultrasonic welding a final test of the safety function of the electronic is strictly recommended.

**Multicell Configurations**

The recommended maximum number of cells in series is 2 for any standard configuration, but need a special PCM for 2 cells in series to be controlled. For any higher number of cells in series please consult our sales staff.

The number of possible cells in parallel is 2 for any standard configuration. Higher numbers are possible; in this case, too, please contact your respective sales engineer at VARTA Microbattery.

For these multicell applications cells should be matched in regard to capacity, OCV and internal impedance. Each cell should be equipped with 1 Thermofuse / Polyswitch as passive protection unless the secondary protection is built into the PCM.

For further information please see also the previous chapter “Proper Use and Handling” in this handbook.
